

Disconnect both the six and four pin connector from the control module. Checks will be performed on the vehicle end of the harness. Turn vehicle ignition and A/C controls in cab to the on position. Voltage checks should be between 11.0 and 16.0 volts.

*** Start delay, compressor lubrication cycle.**

- The A/C compressor is held off for the first 15 seconds after ignition switch engagement (module power up).
- After start delay the A/C compressor is turned on for 15 seconds if the high pressure state, low pressure switch state, clutch state and system voltage is correct.
- **Note:** The T-stat input is ignored during this period.

**** High pressure switch note:**

If system is exhibiting abnormal high head pressure and/or the pressure relief valve on the A/C compressor is being blown open, first verify no restriction or blockage is present on the high side of the system, if no restriction is present replace high pressure switch. This is a indication of the high pressure switch not opening when pressure rises above 300PSI.

Note: Pressure differential can be up to 5-PSI lower per foot from compressure to high pressure switch. Red headed pressure switches set at 350PSI.

***** Thermostatic (t-stat) switch note:**

If a t-stat fails in the closed position the compressor clutch will run continuously and the evaporator will freeze up.

****** ECM fan output**

Pin 3 is the ECM fan output. Voltage should read between 5 and 12 volts. With the ignition in the off position, jumper pin 4 to pin 3. Turn the vehicle on, if the engine fan is engaged the problem is not in the control module. If the engine fan is not engaged, inspect proper operation of solenoid valve, relay, fan blades and/or related components. If all components check good, replace the control module.

Connector Pin Out

If vehicle is experiencing intermittent problems and/or module is flashing a three blink code after determining vehicle checks are in specification, refer to CM-812 Product Description & Troubleshooting Manual for more detailed troubleshooting information. It is recommended that an external ground wire is added to the body of the compressor to the ground post of the alternator, it may also be necessary to add the same ground wire to the control module.
